1. INTRODUCTION

Supermarkets are complex systems that manage various operational aspects, from inventory control to customer engagement. With rising customer expectations and an increasingly competitive retail landscape, it has become essential to adopt advanced technological solutions. This project focuses on developing a customized Point of Sale (POS) system tailored to the needs of a supermarket.

The proposed system is not just a cash register replacement but an all-encompassing solution designed to handle sales, stock management, discounts, and reporting. By automating key processes and providing real-time insights, the system aims to improve operational efficiency, reduce errors, and empower management to make informed decisions for business growth.

1.1 OVERVIEW OF THE SUPER MARKET'S POS SYSTEM REQUIREMENTS.

The supermarket imagines a smart and reliable **POS system** (EDB, 2024) that brings together several essential features to meet its unique needs and streamline operations.

I. CUSTOMER MANAGEMENT

The POS system will store and manage customer information, enabling personalized interactions. Key functionalities include,

- Recording details such as names, contact numbers, and purchase histories.
- Supporting loyalty programs where customers can earn and redeem points.
- Enabling targeted promotions based on purchase trends, such as offering discounts to high-spending customers.

II. STOCK MANAGEMENT

Inventory control is a critical aspect of retail operations. The system will,

- Maintain real-time inventory levels to avoid stockouts or overstocking.
- Provide notifications for low-stock or expiring items to prevent wastage.
- Allow categorization of products by attributes like brand, category, and expiry date for efficient tracking.

III. DISCOUNT AND PROMOTIONS MANAGEMENT

To attract and retain customers, discounts and promotions must be managed seamlessly by,

- Automatically apply discounts based on predefined rules, such as percentage discounts or "Buy 1 Get 1 Free" offers.
- Allow staff to update discount policies quickly during promotional events.
- Ensure discounts are accurately reflected in the final billing.

IV. SALES MANAGEMENT.

Sales processing is at the heart of the POS system. Its features will include,

- Recording each transaction with details like item, quantity, price, and timestamp.
- Supporting multiple payment (Wikipedia, 2024) methods, including cash, cards, and mobile payments.
- Ensuring receipts are generated and printed quickly to reduce checkout delays.

V. REPORTING AND ANALYTICS

Management needs actionable data to make decisions. The reporting module will:

- Generate daily, weekly, and monthly reports summarizing sales, revenue, and inventory usage.

- Highlight trends such as best-selling items or peak shopping times.
- Present data visually through charts and graphs for better understanding.

1.2 IDENTIFIED BUSINESS NEEDS AND CHALLENGES.

BUSINESS NEEDS

- **Automation:** Automating tasks like inventory updates, sales recording, and discount application will reduce the manual workload and errors.
- **Real-Time Data Access:** Managers and staff require instant updates on inventory and sales to make timely decisions.
- **Customer Engagement:** Personalized interactions through loyalty programs and promotions will improve customer satisfaction and retention.
- **Data-Driven Decisions:** Reports on sales trends and stock levels are essential for effective planning and forecasting.

CHALLENGES

- **Scalability:** The system must be flexible to accommodate future expansions, such as new branches or online sales.
- **Security:** Protecting sensitive customer and business data from unauthorized access is critical.
- **User Adoption:** Designing a user-friendly interface will be necessary to ensure that staff can use the system efficiently with minimal training.
- **Data Accuracy:** Maintaining accurate and consistent data across all modules of the system is a major technical challenge.

1.3 OBJECTIVES OF THE DATABASE AND APPLICATION DEVELOPMENT.

PRIMARY OBJECTIVES

1. **Streamline Operations:** Automate repetitive tasks to save time and reduce human errors.
2. **Ensure Data Integrity:** Use database constraints and validation rules to maintain data consistency.
3. **Empower Management:** Provide detailed reports and analytics to assist in decision-making.
4. **Enhance User Experience:** Create a simple and intuitive interface for all system users.

SECONDARY OBJECTIVES

- Allow easy updates to discount and stock information.
- Provide secure access to sensitive data with role-based permissions.
- Offer scalability to support future business growth.

1.4 ASSUMPTIONS AND CONSTRAINTS.

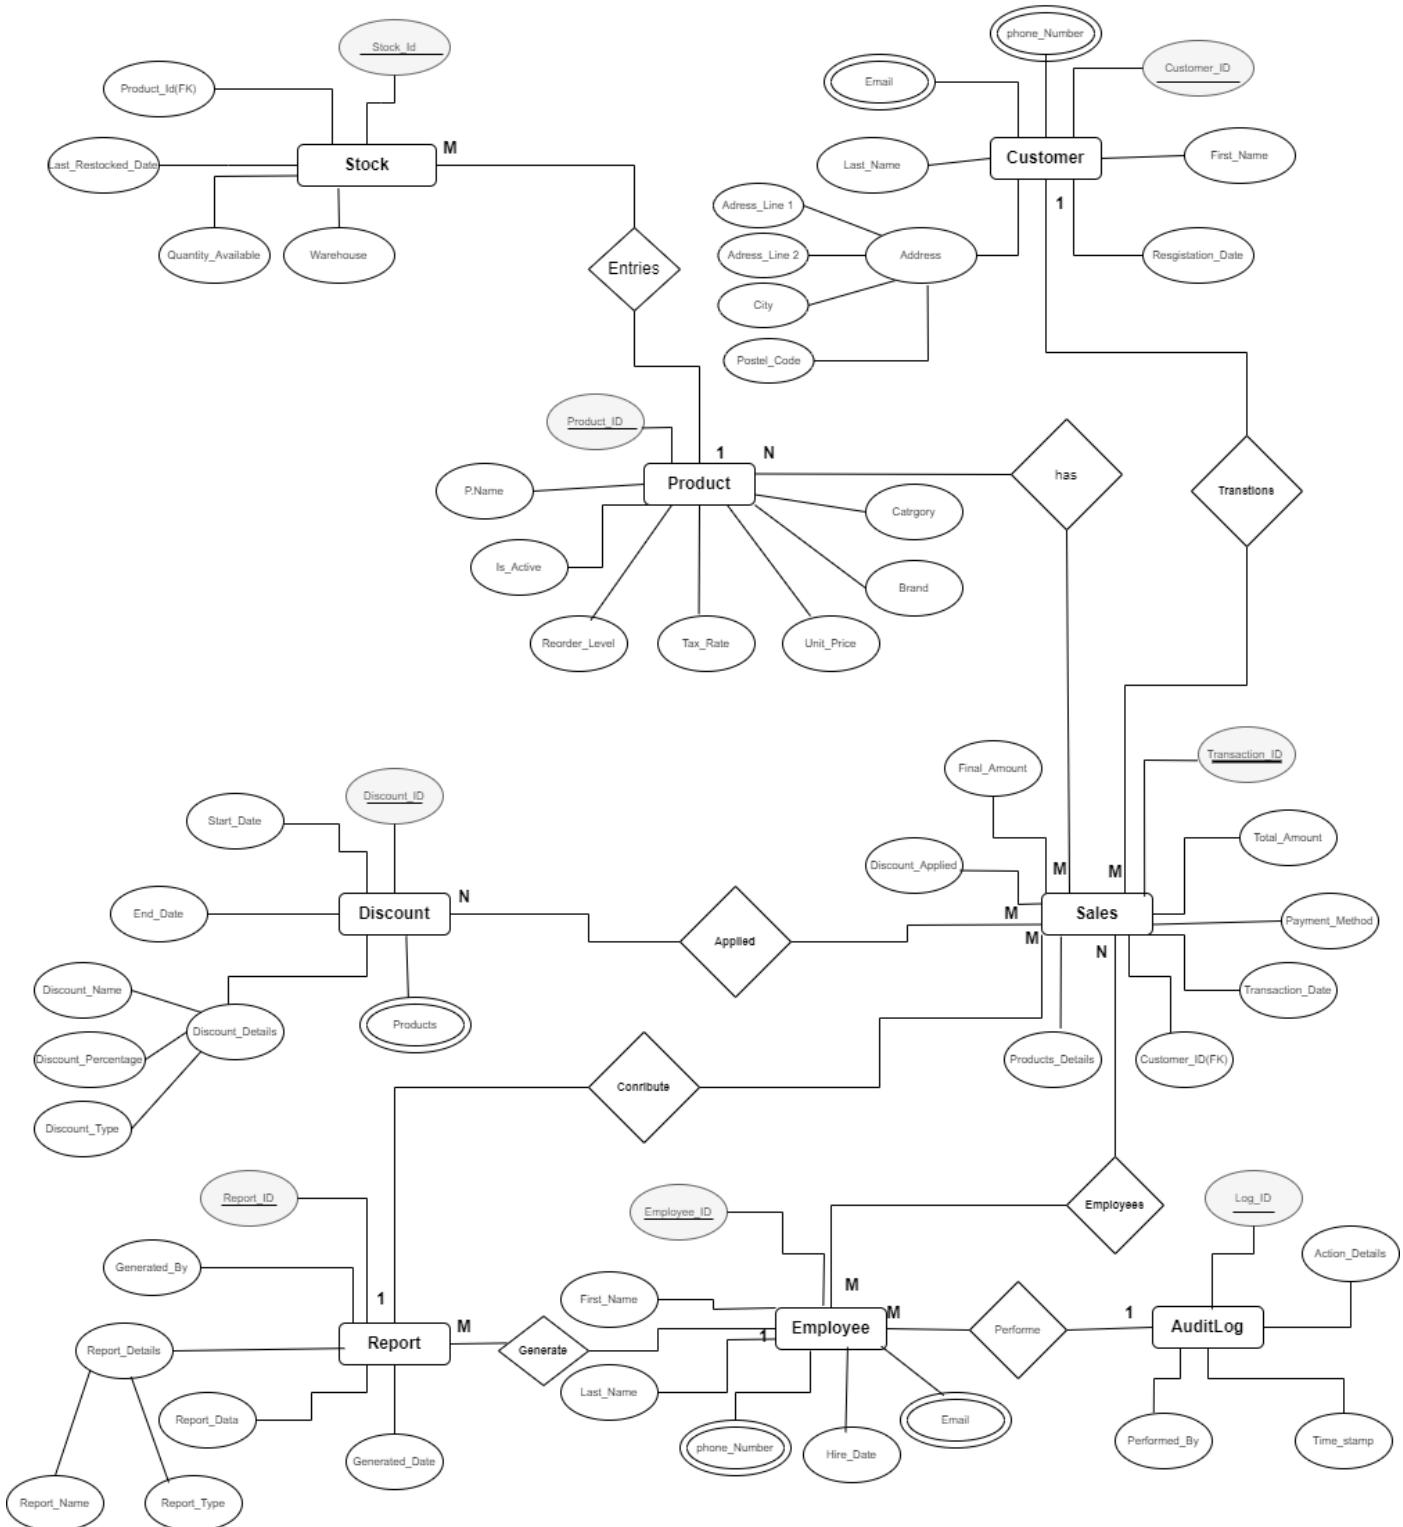

ADDITIONAL ASSUMPTIONS

- The supermarket primarily operates offline, and this system will be deployed locally with optional cloud backup.
- Staff using the system have basic knowledge of computers and will receive training for the application.
- Discount rules and stock categories will be predefined by the management during the setup phase.
- The supermarket's internet connectivity is reliable for any optional online integrations in the future.

CONSTRAINTS ON DATA HANDLING AND SOFTWARE FEATURES

- **Data Accuracy:** Data validation (CFI, 2024) will be enforced through primary keys, foreign keys, and constraints. For instance, a sales transaction cannot occur without a corresponding product in stock.
- **Performance:** The system must handle peak transaction loads efficiently, especially during busy hours.
- **Security:** Sensitive information, such as customer details and payment records, must be encrypted and accessible only to authorized users.
- **Compliance:** The system must adhere to relevant data protection laws and industry standards.

2. ER/EER DIAGRAM.

2.1 ASSUMPTIONS FOR THE ER/EER DIAGRAM (MICROSOFT, 2024)

CUSTOMER:

- Each customer has a unique CustomerID.
- Customers can register in the system, and their details such as name, email, and phone numbers are stored.
- A customer can make multiple transactions (1:M relationship with Sales).

PRODUCT:

- Each product has a unique ProductID.
- Products belong to specific categories.
- ReorderLevel indicates the minimum quantity of a product before it needs restocking.
- **Product - Stock:** Each product can have different stock levels across various warehouses. (1:M)

STOCK:

- Each Stock is uniquely identified by a Stock_ID.
- Stock shows us the last Restocked date.
- Stocks are stored in a WareHouse.

DISCOUNT:

- Discounts are applied to Sales, creating an M:N relationship between products and Sales.
- Each discount is uniquely identified by a DiscountID and includes details like Discount Details, start date, and end date.
- Discounts can apply to multiple Sales.

SALES:

- Each sales transaction is uniquely identified by a TransactionID.
- Sales include details of the customer making the purchase, the Discount method, and the Employees.
- Discounts applied during sales are linked to the transaction.

EMPLOYEE:

- Employees are uniquely identified by EmployeeID.
- Each employee have Employee Id, contact information, First and Last Name.
- Employees perform actions logged in the AuditLog.

AUDIT LOGGING:

- Actions performed by employees (e.g., adding, modifying, or deleting data) are recorded in the AuditLog with details of the action and a time.

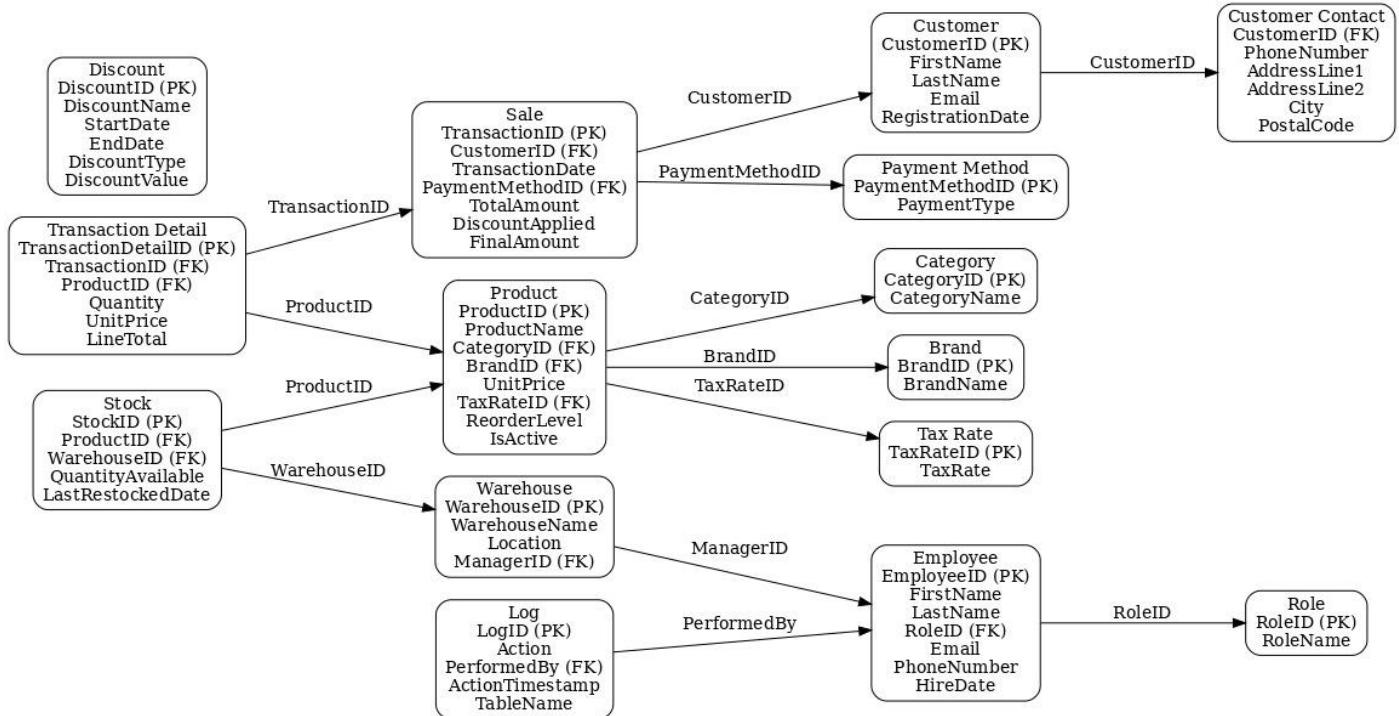

REPORT GENERATION:

- Reports are uniquely identified by a ReportID and include details such as the report type, generation date, and generated by (an employee).
- Reports are generated daily or monthly to help the owner make informed decisions.
- Sales and other operational data contribute to report generation (1:M relationship between Reports and Sales).

RELATIONSHIPS AND CARDINALITY:

- A customer can have multiple transactions (1:M between Customer and Sales).
- A Sales can belong to multiple discounts, and discounts can apply to multiple Sales (N:N between Sales and Discount).
- Employees can generate multiple reports and perform multiple actions logged in the audit (1:N relationships)

3. RELATIONAL MAPPING

4. NORMALIZATION

4.1 FIRST NORMAL FORM – 1NF

In **1NF** (Wikipedia, 2024), all data must be atomic (no multi-valued attributes), and there must be a unique identifier for each row.

I. CUSTOMER MANAGEMENT

CustomerID	FirstName	LastName	Email	PhoneNumber	AddressLine1	AddressLine2	City	PostalCode	RegistrationDate
C123	John	Doe	john@email.com	12345678 90	Line1	Line2	New York	10001	2024-01-01
C124	Jane	Smith	jane@email.com	09876543 21	Line3	Line4	Chicago	60606	2024-02-01

II. PRODUCT MANAGEMENT

ProductID	ProductName	Category	Brand	UnitPrice	TaxRate	ReorderLevel	IsActive
P101	TV	Electronics	Sony	1000.00	10%	5	Yes
P102	Sofa	Furniture	Ikea	500.00	5%	2	Yes

III. STOCK MANAGEMENT

StockID	ProductID	Warehouse	QuantityAvailable	LastRestockedDate
S001	P101	Warehouse1	10	2024-01-10
S002	P102	Warehouse2	5	2024-01-15

IV. DISCOUNT MANAGEMENT

DiscountID	DiscountName	StartDate	EndDate	DiscountDetails
D001	Summer Sale	2024-06-01	2024-06-30	15%, Percentage

V. SALES MANAGEMENT

TransactionID	CustomerID	Transaction Date	PaymentMethod	TotalAmount	DiscountApplied	FinalAmount	ProductDetails
T001	C123	2024-01-05	Credit Card	2000.00	15%	1700.00	P101: 2 units, \$1000/unit

VI. EMPLOYEE MANAGEMENT

EmployeeID	FirstName	LastName	Role	ContactInfo	HireDate
E001	Alice	Brown	Manager	alice@company.com , 1234567	2020-01-01

4.2 SECOND NORMAL FORM – 2NF

To achieve **2NF**, all partial dependencies (fields depending only on part of a composite key) are removed. This step involves creating separate tables for attributes that do not directly depend on the primary key.

I. CUSTOMER MANAGEMENT

CustomerID		FirstName		RegistrationDate	
C123		John Doe		john@email.com	
CustomerID	PhoneNumber	AddressLine1	AddressLine2	City	PostalCode
C123	1234567890	Line1	Line2	New York	10001

II. PRODUCT MANAGEMENT

ProductID	ProductName	UnitPrice	ReorderLevel	IsActive
P101	TV	1000.00	5	Yes
ProductID	Category			
P101	Electronics			
ProductID	Brand			
P101	Sony			
ProductID	TaxRate			
P101	10%			

III. STOCK MANAGEMENT

StockID	ProductID	Warehouse	QuantityAvailable	LastRestockedDate
S001	P101	Warehouse1	10	2024-01-10

IV. DISCOUNT MANAGEMENT

DiscountID	DiscountName	StartDate	EndDate
D001	Summer Sale	2024-06-01	2024-06-30
DiscountID	DiscountType	DiscountValue	
D001	Percentage	15%	

V. SALES MANAGEMENT

TransactionID	CustomerID	TransactionDate	PaymentMethod	TotalAmount	DiscountApplied	FinalAmount
T001	C123	2024-01-05	Credit Card	2000.00	15%	1700.00
TransactionID	ProductID	Quantity	UnitPrice	LineTotal		
T001	P101	2	1000.00	2000.00		

VI. EMPLOYEE MANAGEMENT

EmployeeID	FirstName	LastName	RoleID	HireDate			
E001	Alice	Brown	R001	2020-01-01			
RoleID	RoleName						
R001	Manager						
EmployeeID	ContactInfo						
E001	alice@company.com , 1234567						

4.3 THIRD NORMAL FORM – 3NF

To achieve **3NF**, all transitive dependencies (attributes depending on non-primary key attributes) are removed. The following tables demonstrate the fully normalized structure:

I. CUSTOMER MANAGEMENT

CustomerID	FirstName	LastName	Email	RegistrationDate	
C123	John	Doe	john@email.com	2024-01-01	
CustomerID	PhoneNumber	AddressLine1	AddressLine2	City	PostalCode
C123	1234567890	Line1	Line2	New York	10001

II. PRODUCT MANAGEMENT

ProductID	ProductName	CategoryID	BrandID	UnitPrice	TaxRateID	ReorderLevel	IsActive
P101	TV	CAT01	BR01	1000.00	TAX01	5	Yes
CategoryID	CategoryName						
CAT01	Electronics						
BrandID	BrandName						
BR01	Sony						
TaxRateID	TaxRate						
TAX01	10%						

III. STOCK MANAGEMENT

StockID	ProductID	WarehouseID	QuantityAvailable	LastRestockedDate	
S001	P101	WH01	10	2024-01-10	
WarehouseID	WarehouseName	Location	ManagerID		
WH01	Warehouse1	New York City	E001		

IV. DISCOUNT MANAGEMENT

DiscountID	DiscountName	StartDate	EndDate	DiscountType	DiscountValue
D001	Summer Sale	2024-06-01	2024-06-30	Percentage	15%

V. SALES MANAGEMENT

TransactionID	CustomerID	TransactionDate	PaymentMethodID	TotalAmount	DiscountApplied	FinalAmount
T001	C123	2024-01-05	PM01	2000.00	15%	1700.00

TransactionDetailID	TransactionID	ProductID	Quantity	UnitPrice	LineTotal
TD001	T001	P101	2	1000.00	2000.00
PaymentMethodID	PaymentType				
PM01	Credit Card				

VI. EMPLOYEE MANAGEMENT

EmployeeID	FirstName	LastName	RoleID	Email	PhoneNumber	HireDate
E001	Alice	Brown	R001	alice@company.com	1234567890	2020-01-01
RoleID	RoleName					
R001	Manager					
LogID	Action	PerformedBy	ActionTimestamp	TableName		
LOG001	Update Stock	E001	2024-01-10 10:30:00	Stock		

VII. REPORT GENERATION

ReportID	ReportName	GeneratedBy	GeneratedDate	ReportType	ReportData
REP001	Daily Sales Report	E001	2024-01-11	Sales	JSON Data

4.4 PROCESS OF NORMALIZATION

Normalization (Geeks for Geeks, 2024) is a systematic approach to organizing data in a database to reduce redundancy and improve data integrity. This document explains normalization through **1NF**, **2NF**, and **3NF**, using examples to demonstrate how redundant data is removed at each stage.

4.4.1 1NF (FIRST NORMAL FORM)

DEFINITION

1NF ensures that:

- All columns in a table contain atomic (indivisible) values.
- Each record is unique, and there are no duplicate rows.
- There are no repeating groups or arrays within the table.

EXAMPLE: DATA IN UNNORMALIZED FORM (0NF)

Consider a CustomerOrders table that stores customer orders.

CustomerID	CustomerName	Orders
C001	John Doe	TV: 2 units, \$1000/unit; Sofa: 1 unit, \$500
C002	Jane Smith	TV: 1 unit, \$1000/unit

TRANSITION TO 1NF

To achieve 1NF:

- Split multi-valued attributes (e.g., Orders) into atomic values.
- Create a separate row for each unique order.

CustomerID	CustomerName	ProductName	Quantity	UnitPrice
C001	John Doe	TV	2	1000
C001	John Doe	Sofa	1	500
C002	Jane Smith	TV	1	1000

4.4.2 2NF (SECOND NORMAL FORM)

DEFINITION

2NF eliminates partial dependencies, where non-primary key attributes depend only on part of a composite primary key. To achieve 2NF:

- Move attributes that are dependent on only part of the primary key to a separate table.
- Ensure all attributes depend on the entire primary key.

EXAMPLE: DATA IN 1NF

Continuing with the CustomerOrders table:

CustomerID	CustomerName	ProductName	Quantity	UnitPrice
C001	John Doe	TV	2	1000
C001	John Doe	Sofa	1	500
C002	Jane Smith	TV	1	1000

IDENTIFYING PARTIAL DEPENDENCIES

- CustomerName depends only on CustomerID.
- UnitPrice depends only on ProductName.

TRANSITION TO 2NF

Split the table into two separate tables:

Customer Table

CustomerID	CustomerName
C001	John Doe
C002	Jane Smith

Product Table

ProductName	UnitPrice
TV	1000
Sofa	500

CustomerOrders Table

CustomerID	ProductName	Quantity
C001	TV	2
C001	Sofa	1
C002	TV	1

By eliminating partial dependencies, redundancy is reduced. For example, the price of a product is stored only once in the Product table, rather than being repeated for every order.

4.4.3 3NF (THIRD NORMAL FORM)

DEFINITION

3NF eliminates transitive dependencies, where a non-primary key attribute depends on another non-primary key attribute. To achieve 3NF:

- Move attributes that do not directly depend on the primary key to a separate table.

EXAMPLE: DATA IN 2NF

Consider the Customer table:

CustomerID	CustomerName	City	PostalCode
C001	John Doe	New York	10001
C002	Jane Smith	Chicago	60606

IDENTIFYING TRANSITIVE DEPENDENCIES

- City depends on PostalCode.
- CustomerID is the primary key.

TRANSITION TO 3NF

Split the table into two separate tables:

Customer Table

CustomerID	CustomerName	PostalCode
C001	John Doe	10001
C002	Jane Smith	60606

Location Table

PostalCode	City
10001	New York
60606	Chicago

By removing transitive dependencies, redundancy is further reduced. For instance, the city corresponding to a postal code is stored only once in the Location table.

4.4.4 SUMMARY OF NORMALIZATION STEPS

Normalization Form	Key Action	Result
1NF	Remove multi-valued attributes	Atomic values and unique rows
2NF	Eliminate partial dependencies	Attributes depend on the entire primary key
3NF	Eliminate transitive dependencies	Attributes depend only on the primary key

By applying normalization, we ensure the database is efficient, consistent, and free of unnecessary redundancy. This improves data integrity and minimizes the risk of anomalies during data manipulation.

5. DATA DICTIONARY

5.1 CUSTOMER MANAGEMENT

Table Name	Field Name	Data Type	Length	Constraints	Description
Customer	CustomerID	INT	-	Primary Key, Not Null, Auto Increment	Primary Key
	FirstName	VARCHAR	100	Not Null	Customer's first name
	LastName	VARCHAR	100	Not Null	Customer's last name
	Email	VARCHAR	255	Not Null, Unique	Customer's email address
	PhoneNumber	VARCHAR	11	Not Null	Customer's phone number
	AddressLine1	VARCHAR	255	Not Null	Primary address line
	AddressLine2	VARCHAR	255	Null	Secondary address line
	City	VARCHAR	100	Not Null	City of residence
	PostalCode	VARCHAR	20	Not Null	Postal code
	RegistrationDate	DATE	-	Not Null	Date of registration

5.2 PRODUCT AND STOCK MANAGEMENT

Table Name	Field Name	Data Type	Length	Constraints	Description
Product	ProductID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	ProductName	VARCHAR	255	Not Null	Name of the product
	CategoryID	INT		Foreign Key, Not Null	Foreign Key to Category
	BrandID	INT		Foreign Key, Not Null	Foreign Key to Brand
	UnitPrice	DECIMAL	10,2	Not Null	Price per unit
	TaxRateID	INT		Foreign Key, Not Null	Foreign Key to TaxRate
	ReorderLevel	INT		Not Null	Stock level to trigger reorder
	IsActive	BOOLEAN		Not Null	Indicates if the product is active
Table Name	Field Name	Data Type	Length	Constraints	Description
Category	CategoryID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	CategoryName	VARCHAR	255	Not Null	Name of the category

Table Name	Field Name	Data Type	Length	Constraints	Description
Brand	BrandID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	BrandName	VARCHAR	255	Not Null	Name of the brand

Table Name	Field Name	Data Type	Length	Constraints	Description
TaxRate	TaxRateID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	TaxRate	DECIMAL	5,2	Not Null	Tax percentage applied

Table Name	Field Name	Data Type	Length	Constraints	Description
Stock	StockID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	ProductID	INT	5,2	Foreign Key, Not Null	Foreign Key to Product
	WarehouseID	INT		Foreign Key, Not Null	Foreign Key to Warehouse
	QuantityAvailable	INT		Not Null	Quantity available in stock
	LastRestockedDate	DATE		Not Null	Date when stock was last restocked

Table Name	Field Name	Data Type	Length	Constraints	Description
Warehouse	WarehouseID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	WarehouseName	VARCHAR	255	Not Null	Name of the warehouse
	Location	VARCHAR	255	Not Null	Location of the warehouse
	ManagerID	INT		Foreign Key, Not Null	Foreign Key to Employee

5.3 DISCOUNT MANAGEMENT

Table Name	Field Name	Data Type	Length	Constraints	Description
Discount	DiscountID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	DiscountName	VARCHAR	5,2	Not Null	Name of the discount
	StartDate	DATE		Not Null	Start date of the discount
	EndDate	DATE		Not Null	End date of the discount
	DiscountPercentage	DECIMAL	5,2	Not Null	Percentage of discount
	DiscountType	VARCHAR	50	Not Null	Type of discount (e.g., Percentage, Flat)

Table Name	Field Name	Data Type	Length	Constraints	Description
ProductDiscount	ProductDiscountID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	ProductID	INT		Foreign Key, Not Null	Foreign Key to Product
	DiscountID	INT		Foreign Key, Not Null	Foreign Key to Discount

5.4 SALES MANAGEMENT

Table Name	Field Name	Data Type	Length	Constraints	Description
SalesTransaction	TransactionID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	CustomerID	INT		Foreign Key (Nullable for Guest Customers)	Foreign Key to Customer, Nullable for Guest Customers
	TransactionDate	DATE		Not Null	Date of transaction
	PaymentMethodID	INT		Foreign Key, Not Null	Foreign Key to PaymentMethod
	TotalAmount	DECIMAL	10,2	Not Null	Total amount before discounts
	DiscountApplied	DECIMAL	5,2	Not Null	Discount applied to the transaction
	FinalAmount	DECIMAL	10,2	Not Null	Final amount after discounts

Table Name	Field Name	Data Type	Length	Constraints	Description
SalesTransactionDetail	TransactionDetailID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	TransactionID	INT		Foreign Key, Not Null	Foreign Key to SalesTransaction
	ProductID	INT		Foreign Key, Not Null	Foreign Key to Product
	Quantity	INT		Not Null	Quantity of product sold
	UnitPrice	DECIMAL	10,2	Not Null	Price per unit
	LineTotal	DECIMAL	10,2	Not Null	Total price for the line item
Table Name	Field Name	Data Type	Length	Constraints	Description
PaymentMethod	PaymentMethodID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	PaymentType	VARCHAR	50	Not Null	Type of payment (e.g., Cash, Credit Card, Mobile Payment)

5.5 EMPLOYEE MANAGEMENT

Table Name	Field Name	Data Type	Length	Constraints	Description
Employee	EmployeeID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	FirstName	VARCHAR	100	Not Null	First name of the employee
	LastName	VARCHAR	100	Not Null	Last name of the employee
	RoleID	INT		Foreign Key, Not Null	Foreign Key to Role
	Email	VARCHAR	255	Not Null	Employee's email address
	PhoneNumber	VARCHAR	11	Not Null	Employee's phone number
	HireDate	DATE		Not Null	Date of hire

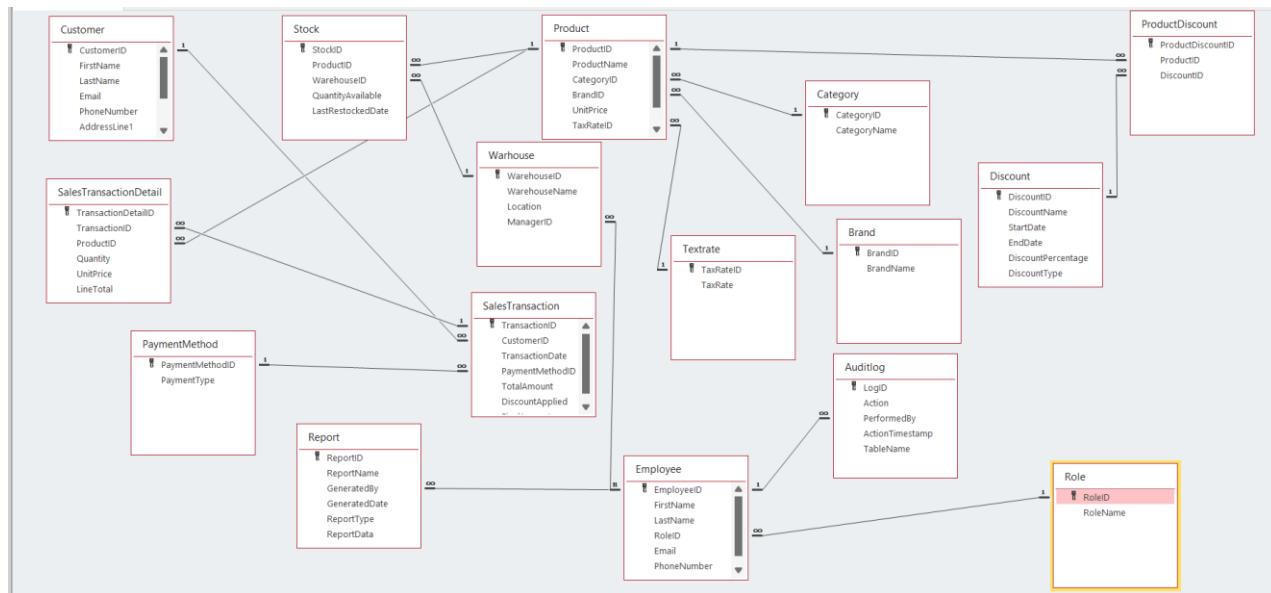

Table Name	Field Name	Data Type	Length	Constraints	Description
Role	RoleID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	RoleName	VARCHAR	100	Not Null	Name of the role (e.g., Admin, Cashier, Manager)

Table Name	Field Name	Data Type	Length	Constraints	Description
AuditLog	LogID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	Action	TEXT		Not Null	Description of the action
	PerformedBy	INT		Foreign Key to Employee, Not Null	Foreign Key to Employee
	ActionTimestamp	TIMESTAMP		Not Null	Timestamp of the action
	TableName	VARCHAR	100	Not Null	Name of the table affected

5.6 REPORT GENERATION

Table Name	Field Name	Data Type	Length	Constraints	Description
Report	ReportID	INT		Primary Key, Not Null, Auto Increment	Primary Key
	ReportName	VARCHAR	255	Not Null	Name of the report
	GeneratedBy	INT		Foreign Key to Employee	Foreign Key to Employee
	GeneratedDate	DATE		Not Null	Date the report was generated
	ReportType	VARCHAR	50	Not Null	Type of report (e.g., Daily, Monthly, Sales Summary)
	ReportData	BLOB/JSON		Not Null	Data in the report (Blob or JSON)

RELATIONSHIP DIAGRAM

PURPOSE

Manages customer information like personal details, contact information, and registration date. Essential for identifying and contacting customers (IBM, 2024).

DATA VALIDATION

- **Primary Key Constraint:** (CustomerID) Ensures unique identification of each customer.
- **NOT NULL Constraints:** Prevent missing essential details like (FirstName) and (LastName).
- **CHECK Constraints:**
 - Validates (FirstName) and (LastName) length.
 - Ensures (Email) follows a valid format and is unique.
 - Validates (PhoneNumber) starts with digits.
 - Limits (PostalCode) length.

CODE & OUTPUT RESULTS.

SQLQuery2.sql - DILSHAN\dilsh (78)* # X

```

/*

PORPOSE

Maintains employee information (Resource for Employee, 2024), linking employees to roles. Tracks hire dates and contact details for the organization.

DATA VALIDATION

- **Primary Key Constraint:** (EmployeeID) Uniquely identifies employees.
- **Foreign Key Constraint:** (RoleID) Links employees to roles.
- **NOT NULL Constraints:** Prevent missing essential details like (FirstName), (LastName), (Email) and (HireDate)
- **CHECK Constraints:**
 - Validates (FirstName), (LastName), and (Email) format.
 - Ensures (HireDate) is not in the future.

CODE & OUTPUT RESULTS

SQLQuery1.sql - DL..ILSHAN\dilsh (78)*

```

/*
-- Creating Employee table
*/
CREATE TABLE Employee (
    EmployeeID INT PRIMARY KEY IDENTITY(1,1),
    FirstName NVARCHAR(100) NOT NULL CHECK (LEN(FirstName) > 1),

DILSHAN\SQLEXPRESS02 (16.0 ... DILSHAN\dilsh (78) SuperStorePOS 00:00:00 0 rows

6.2.2 “ROLE” TABLE

The screenshot shows a SQL query window titled "SQLQuery1.sql - DI...ILSHAN\dilsh (76)*". The query is:

```
SELECT *  
FROM Role;
```

The results pane displays the data from the "Role" table:

	RoleId	RoleName
1	1	Admin
2	2	Cashier
3	3	Manager
4	4	Inventory Supervisor
5	5	Sales Representative
6	6	Accountant
7	7	Warehouse Manager
8	8	Customer Service Representative
9	9	IT Support Specialist
10	10	Marketing Executive
11	11	Delivery Coordinator

PORPOSE

Defines roles (e.g. Admin, Manager) for employees, helping assign and manage responsibilities.

DATA VALIDATION

- **Primary Key Constraint:** (RoleId) Ensures unique role identification.
- **NOT NULL Constraints:** Ensure (RoleName) is not empty.

PURPOSE

Stores generated reports, linking them to the responsible employee. Useful for record-keeping and analysis.

DATA VALIDATION

- **Primary Key Constraint:** (ReportID) Uniquely identifies reports.
- **Foreign Key Constraint:** (GeneratedBy) Links reports to generating employees.
- **NOT NULL Constraints:** Prevent missing essential details (GeneratedDate) and (ReportType).
- **CHECK Constraints:**
 - Ensures (ReportName) has at least 1 character

6.4 PRODUCT AND STOCK MANAGEMENT

6.4.1. “PRODUCT” TABLE

The screenshot shows a SQL query window with the following details:

- Query: `SELECT * FROM Product;`
- Results pane showing 27 rows of product data.
- Columns: ProductID, ProductName, CategoryID, BrandID, UnitPrice, TaxRateID, ReorderLevel, IsActive.
- Data examples:
 - ProductID 1: Anchor Full Cream Milk Powder
 - ProductID 2: Kotmale Fresh Milk 1L
 - ProductID 3: Highland Butter 200g

PURPOSE

Manages product information, including category, brand, pricing, and tax rates. Ensures active product status.

DATA VALIDATION

- **Primary Key Constraint:** (ProductID) Ensures unique identification of products.
- **Foreign Key Constraints:** (CategoryID), (BrandID), (TaxRateID) Link products table to Category, Brand, and TaxRate tables.
- **NOT NULL Constraints:** Prevent missing essential details like (ProductName), (UnitPrice), (ReorderLevel) and (IsActive) status.
- **CHECK Constraints:**
 - Ensure (ProductName) is valid.
 - Validate (UnitPrice) and (ReorderLevel) are non-negative.

CODE & OUTPUT RESULTS

SQLQuery2.sql - Di...ILSHAN\dilsh (78)*

```

/*
-- Creating Product table
*/

6.4.5. “WHEREHOSE” TABLE

	WarehouseID	WarehouseName	Location	ManagerID
1	1	Central Warehouse	Colombo	13
2	2	Kandy Distribution Center	Kandy	14
3	3	Southern Storage	Galle	15
4	4	Northern Depot	Jaffna	16
5	5	Eastern Hub	Trincomalee	17
6	6	Western Storage	Negombo	18
7	7	Hill Country Depot	Nuwara Eliya	19
8	8	North Western Facility	Kurunegala	20
9	9	Uva Warehouse	Badulla	21
10	10	Sabaragamuwa Depot	Ratnapura	22
11	11	Eastern Highlands Center	Ampara	23
12	12	Coastal Hub	Matara	24
13	13	Dry Zone Depot	Anuradhapura	25
14	14	Urban Storage	Batticaloa	26
15	15	Central Highlands Depot	Hatton	27
16	16	Industrial Hub	Kalutara	28
17	17	Administrative Warehouse	Chilaw	29
18	18	Port Storage	Hambantota	30
19	19	Heritage Hub	Polonnaruwa	31
20	20	Frontier Depot	Monaragala	32

PURPOSE

Tracks warehouse details, including location and manager assignment.

DATA VALIDATION

- **Primary Key Constraint:** (WarehouseID) Unique identifier for warehouses.
- **Foreign Key Constraint:** (ManagerID) Links managers to warehouses, allowing NULL.
- **NOT NULL Constraints:** Ensure (WarehouseName) is not empty.
- **CHECK Constraints:**
 - Check (WarehouseName) is valid.

CODE & OUTPUT RESULTS

SQLQuery2.sql - DILSHAN\dilsh (78)*

```

/*
-- Creating Warehouse table
*/
CREATE TABLE Warehouse (
    WarehouseID INT PRIMARY KEY IDENTITY(1,1),
    WarehouseName NVARCHAR(150) NOT NULL CHECK (LEN(WarehouseName) > 0),
    Location NVARCHAR(255),
    ManagerID INT,
    FOREIGN KEY (ManagerID) REFERENCES Employee(EmployeeID) ON DELETE SET NULL
);

/*

25	Budget Sunday Promo	2024-06-16	2024-06-16	6.00	Weekly

PURPOSE

Manages discounts, ensuring valid date ranges and percentage constraints.

DATA VALIDATION

- **Primary Key Constraint:** (DiscountID) Unique identifier for discounts.
- **NOT NULL Constraints:** Prevent missing essential details like (DiscountName), (DiscountType), (StartDate) and (EndDate).
- **CHECK Constraints:**
 - Ensures (EndDate) is not before (StartDate).

CODE & OUTPUT RESULTS

```
SQLQuery2.sql - DILSHAN\dilsh (78)* p X

25	25	10	27	7	100.00	700.00

PURPOSE

Break down each sales transaction into individual product-level details.

DATA VALIDATION

- **Primary Key Constraint:** (TransactionDetailID) Unique identifier for transaction details.
- **Foreign Key Constraint:** (TransactionID), (ProductID) Link details to SalesTransaction and Product.
- **NOT NULL Constraints:** Ensure (Quantity), (UnitPrice) and (LineTotal) are not empty.
- **CHECK Constraints:**

Ensure (Quantity), (UnitPrice), and (LineTotal) are positive values.

CODE & OUTPUT RESULTS

```
SQLQuery2.sql - DILSHAN\dilsh (78)*  ▾ X
/*
-- Creating SalesTransactionDetail table
*/
CREATE TABLE SalesTransactionDetail (
    TransactionDetailID INT PRIMARY KEY IDENTITY(1,1),

6.7 DATABASE DIAGRAM

7. PROCEDURES & TRIGGERS

7.1 STORED PROCEDURES

sp_InsertCustomer

The **sp_InsertCustomer** procedure will put a new customer into the database and log such an operation into an audit log at the same time. It requires various factors as input, which include: first name, last name, and email of the customer, which are necessary, and other details such as phone number and address which are optional. It then inserts the customer record in the **Customer** table, chooses the new **CustomerID** with **SCOPE_IDENTITY()**, and logs the operation to the **AuditLog** table. Error handling is in place to report any error in execution through the procedure.

sp_GenerateSalesReport

This stored procedure provides a sales report for any specified time. This stored procedure includes two parameters: one for the date commencing the period of the report, and one for the date concluding the report period. This stored method collects all the transactions within the supplied range, together with the transaction ID, customer name, product details, quantity, and money per transaction. Also, the action of report production gets noted in the **AuditLog** table for tracking accountability purposes. Error management (Wikipedia, 2024) has also been provided to control possible execution issues.

sp_AssignProductDiscount

The **sp_AssignProductDiscount** process guarantees a product is awarded a discount only once. It takes a **ProductID** and a **DiscountID** as inputs. Before making the assignment, it verifies whether the combination already exists in the **ProductDiscount** database. If not, it does the insert of the new association and returns a success message. If the combination already exists, the method advises the user. Errors are recorded and reported using an error-handling block.

7.2 TRIGGERS

trg_UpdateStockAfterSale

The `trg_UpdateStockAfterSale` trigger updates the quantities in stock after the recording of a new sale in the `SalesTransactionDetail` database. It decreases the quantity of the sold product in the `Stock` table following an entry, according to the information in the inserted record. Additionally, it logs in the `AuditLog` table the operation performed to update the stock. This trigger is designed to ensure that, after each sale, the stock is updated correctly.

trg_ReorderNotification

The `trg_ReorderNotification` trigger will constantly watch any updates to the `Stock` table and log an alert if the available quantity of any product goes below the reorder level. This trigger will be invoked following the execution of an update operation to make sure that any low-stock condition will promptly be noted in the `AuditLog` table for further action, as this would signal serious stock shortages and therefore enhance inventory efficiency.

trg_LogCustomerDeletion

The `trg_LogCustomerDeletion` trigger writes into the `AuditLog` database facts about which customer records have been removed. Whenever a client is deleted from the `client` table, the trigger extracts data from the `DELETED` pseudo-table, including the customer name and email, and logs an audit trail. This offers traceability of all client data deletions and promotes system responsibility.

8. FUNCTIONS & VIEWS

8.1 CALCULATE TOTAL SALES

FN_CALCULATETOTALSALES

The screenshot shows a SQL Server Management Studio window with four tabs at the top: SQLQuery4.sql, SQLQuery3.sql, SQLQuery2.sql, and SQLQuery1.sql. The SQLQuery1.sql tab contains the following T-SQL code:

```
--CREATE FUNCTION dbo.fn_CalculateTotalSales (@CustomerID INT)
--RETURNS DECIMAL(10, 2)
--AS
--BEGIN
--    DECLARE @TotalSales DECIMAL(10, 2);
--
--    -- Calculate the total sales for the customer by summing the FinalAmount from SalesTransaction
--    SELECT @TotalSales = SUM(T.FinalAmount)
--    FROM SalesTransaction T
--    WHERE T.CustomerID = @CustomerID;
--
--    -- Return the result
--    RETURN ISNULL(@TotalSales, 0); -- Return 0 if no sales are found
--END
```

The status bar at the bottom indicates "DENUONE\SQLEXPRESS (16.0 RTM) | DENUONE\DeNuONE (64) | master | 00:00:00 | 0 rows".

PURPOSE

Calculates the total amount spent by a customer on all transactions.

INPUTS & RETURNS

Input - CustomerID (INT) - The ID of the customer.

Return - The total amount spent by the customer.

CODE & OUTPUT RESULTS

The screenshot shows a SQL Server Management Studio window with five tabs at the top: SQLQuery15.sql, SQLQuery14.sql, SQLQuery13.sql, SQLQuery12.sql, and SQLQuery11.sql. The SQLQuery11.sql tab contains the following T-SQL code:

```
--SELECT dbo.fn_CalculateTotalSales(@CustomerID) AS TotalSales;--
SELECT dbo.fn_CalculateTotalSales(12) AS TotalSales;
```

The status bar at the bottom indicates "DENUONE\SQLEXPRESS (16.0 RTM) | DENUONE\DeNuONE (52) | SuperStorePOS | 00:00:00 | 0 rows".

8.2 CALCULATE PRODUCT SALEFN_CALCULATORPRODUCTSALES

The screenshot shows a SQL Server Management Studio window with four tabs at the top: SQLQuery4.sql, SQLQuery3.sql, SQLQuery2.sql, and SQLQuery1.sql. The SQLQuery1.sql tab contains the following T-SQL code:

```
CREATE FUNCTION dbo.fn_CalculateProductSales (@ProductID INT)
RETURNS DECIMAL(10, 2)
AS
BEGIN
    DECLARE @TotalSales DECIMAL(10, 2);

    -- Calculate the total sales for the product by summing the LineTotal from SalesTransactionDetail
    SELECT @TotalSales = SUM(D.LineTotal)
    FROM SalesTransactionDetail D
    WHERE D.ProductID = @ProductID;

    -- Return the result
    RETURN ISNULL(@TotalSales, 0); -- Return 0 if no sales are found
END
```

The status bar at the bottom indicates "DENUONE\SQLEXPRESS (16.0 RTM) | DENUONE\DeNuONE (68) | master | 00:00:00 | 0 rows".

PURPOSE

Calculates the total sales for a given product.

INPUTS & RETURNS

Input - ProductID (INT) - The ID of the product.

Return - DECIMAL - The total sales for the product.

CODE & OUTPUT RESULTS

The screenshot shows a SQL Server Management Studio window with four tabs at the top: SQLQuery15.sql, SQLQuery14.sql, SQLQuery13.sql, and SQLQuery12.sql. The SQLQuery12.sql tab contains the following T-SQL code:

```
--SELECT dbo.fn_CalculateProductSales(@ProductID) AS TotalSales;
SELECT dbo.fn_CalculateProductSales(12) AS TotalSales;
```

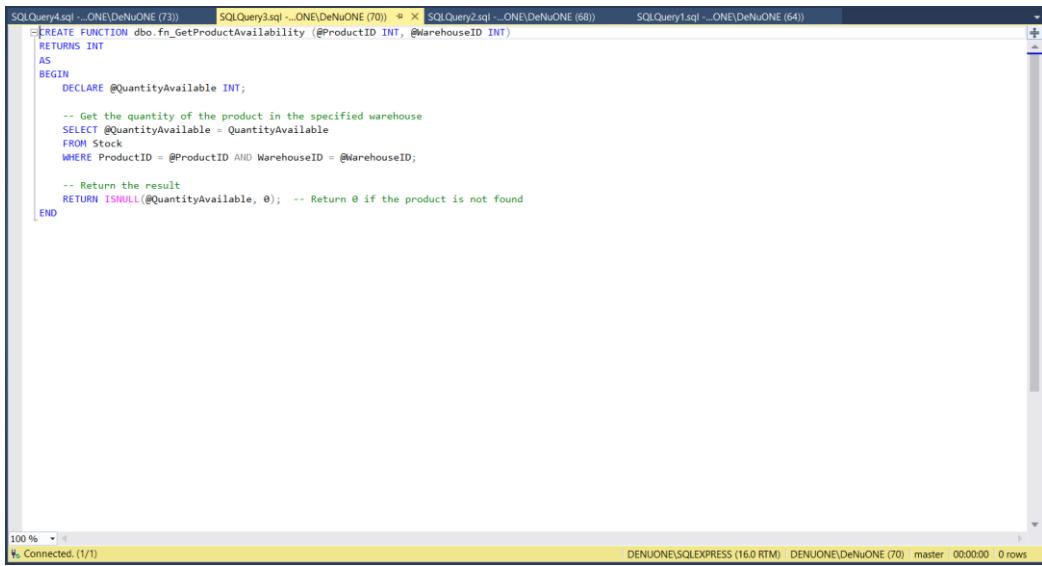

The results pane shows a single row of data:

TotalSales
600.00

The status bar at the bottom indicates "DENUONE\SQLEXPRESS (16.0 RTM) | DENUONE\DeNuONE (63) | SuperStorePOS | 00:00:00 | 1 rows".

8.3 GET PRODUCT AVAILABILITY

FN_GETPRODUCTAVAILABILITY

```
--CREATE FUNCTION dbo.fn_GetProductAvailability (@ProductID INT, @WarehouseID INT)
-- RETURNS INT
AS
BEGIN
    DECLARE @QuantityAvailable INT;

    -- Get the quantity of the product in the specified warehouse
    SELECT @QuantityAvailable = QuantityAvailable
    FROM Stock
    WHERE ProductID = @ProductID AND WarehouseID = @WarehouseID;

    -- Return the result
    RETURN ISNULL(@QuantityAvailable, 0); -- Return 0 if the product is not found
END
```

100 % ▼
Connected. (1/1) DENUONE\SQLEXPRESS (16.0 RTM) | DENUONE\DeNuONE (70) | master | 00:00:00 | 0 rows

PURPOSE

Returns the available quantity of a product in a specific warehouse.

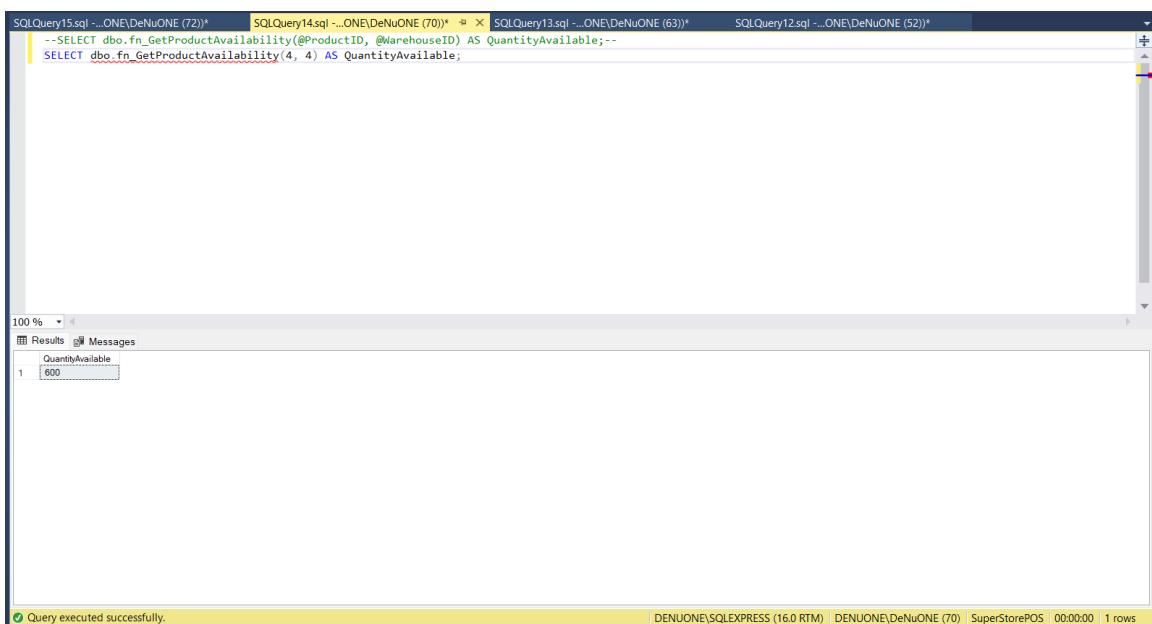

INPUTS & RETURNS

Inputs - ProductID (INT) - The ID of the product.

WarehouseID (INT) - The ID of the warehouse.

Return - The available quantity of the product in the warehouse.

CODE & OUTPUT RESULTS

```
--SELECT dbo.fn_GetProductAvailability(@ProductID, @WarehouseID) AS QuantityAvailable;--
SELECT dbo.fn_GetProductAvailability(4, 4) AS QuantityAvailable;
```

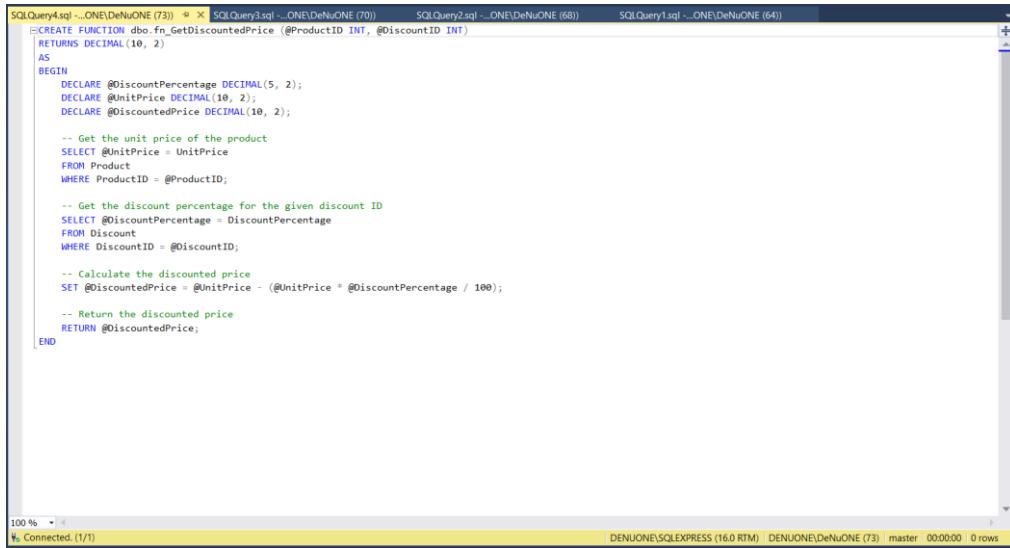

100 % ▼

8.4 GET DISCOUNT PRICE

FN_GETDISCOUNTPRICE

```
CREATE FUNCTION dbo.fn_GetDiscountedPrice (@ProductID INT, @DiscountID INT)
RETURNS DECIMAL(10, 2)
AS
BEGIN
    DECLARE @DiscountPercentage DECIMAL(5, 2);
    DECLARE @UnitPrice DECIMAL(10, 2);
    DECLARE @DiscountedPrice DECIMAL(10, 2);

    -- Get the unit price of the product
    SELECT @UnitPrice = UnitPrice
    FROM Product
    WHERE ProductID = @ProductID;

    -- Get the discount percentage for the given discount ID
    SELECT @DiscountPercentage = DiscountPercentage
    FROM Discount
    WHERE DiscountID = @DiscountID;

    -- Calculate the discounted price
    SET @DiscountedPrice = @UnitPrice - (@UnitPrice * @DiscountPercentage / 100);

    -- Return the discounted price
    RETURN @DiscountedPrice;
END
```

PURPOSE

Calculate the price of a product after applying for a discount.

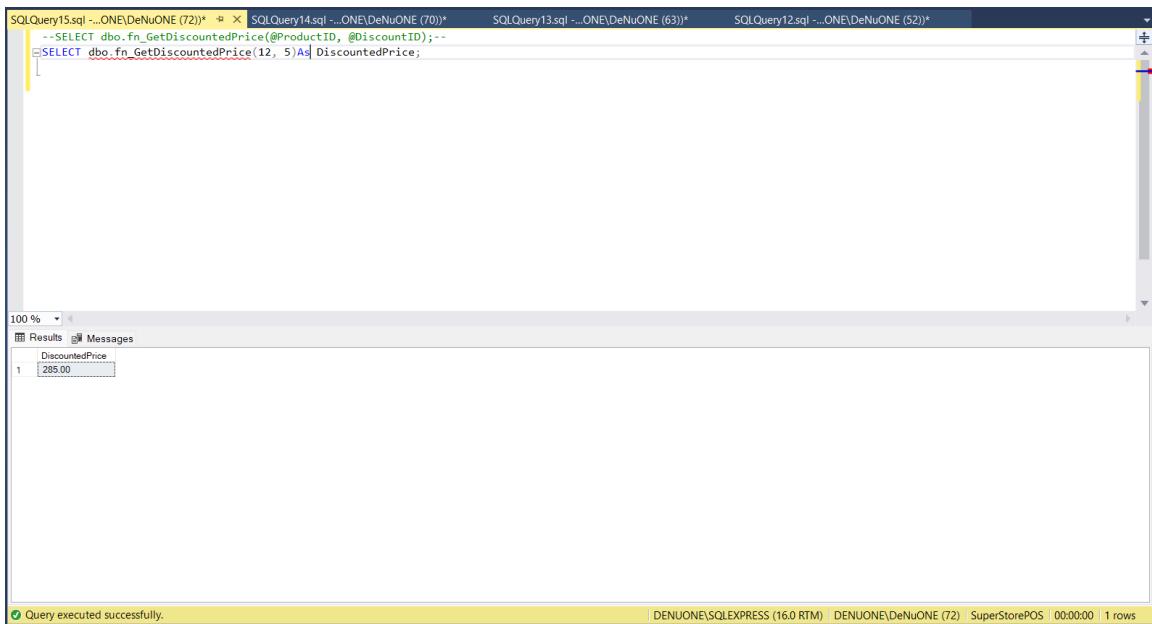

INPUTS & RETURNS

Inputs – ProductID (INT) - The ID of the product.

DiscountID (INT) - The ID of the discount to be applied.

Return - The discounted price of the product.

CODE & OUTPUT RESULTS

```
--SELECT dbo.fn_GetDiscountedPrice(@ProductID, @DiscountID);-
SELECT dbo.fn_GetDiscountedPrice(12, 5)As DiscountedPrice;
```

DiscountedPrice
285.00

Query executed successfully.

8.5 CUSTOMER SALES SUMMERY

VW_CUSTOMERSALESSUMMERY

The screenshot shows a SQL Server Management Studio window with four tabs at the top: SQLQuery8.sql (~...ONE\DeNuONE (64)), SQLQuery7.sql (~...ONE\DeNuONE (65)), SQLQuery6.sql (~...ONE\DeNuONE (54)), and SQLQuery5.sql (~...ONE\DeNuONE (52)). The SQLQuery5 tab contains the following SQL code:

```
-- View Name: vw_CustomerSalesSummary
-- Description: Summary view of total sales and transaction count for each customer
-- =====
CREATE VIEW vw_CustomerSalesSummary AS
SELECT
    C.CustomerID,
    C.FirstName + ' ' + C.LastName AS CustomerName,
    COUNT(T.TransactionID) AS TotalTransactions,
    SUM(T.FinalAmount) AS TotalSpent,
    MAX(T.TransactionDate) AS LastTransactionDate
FROM
    Customer C
    LEFT JOIN SalesTransaction T ON C.CustomerID = T.CustomerID
GROUP BY
    C.CustomerID, C.FirstName, C.LastName;
```

Below the code, the message pane shows "Commands completed successfully." and the completion time: 2024-12-24T10:01:53.7397346+05:00. The status bar at the bottom indicates "DENUONE\SQLEXPRESS (16.0 RTM) | DENUONE\DeNuONE (52) | master | 00:00:00 | 0 rows".

PURPOSE

Summary view of total sales and transaction count for each customer.

CODE & OUTPUT RESULTS

The screenshot shows a SQL Server Management Studio window with five tabs at the top: SQLQuery19.sql (~...ONE\DeNuONE (67)), SQLQuery18.sql (~...ONE\DeNuONE (65)), SQLQuery17.sql (~...ONE\DeNuONE (63)), SQLQuery16.sql (~...ONE\DeNuONE (52)), and SQLQuery15.sql (~...ONE\DeNuONE (51)). The SQLQuery15 tab contains the following SQL code:

```
SELECT * FROM vw_CustomerSalesSummary;
```

The results pane displays a table with 17 rows of data:

	CustomerID	CustomerName	TotalTransactions	TotalSpent	LastTransactionDate
1	1	Kumar Perera	1	1400.00	2024-01-01 10:15:00.000
2	2	Nuwan Fernando	1	2350.00	2024-01-02 15:45:00.000

13	13	Anjana Bandara	1	1850.00	2024-01-13 14:35:00.000
14	14	Kavindu Ekanayake	1	3000.00	2024-01-14 11:45:00.000
15	15	Nedeka Rajapakse	1	4500.00	2024-01-15 16:00:00.000
16	16	Suni Herath	1	2050.00	2024-01-16 10:50:00.000
17	17	Madeeha Saman	1	4000.00	2024-01-17 13:10:00.000

Below the results, the message pane shows "Query executed successfully." and the status bar at the bottom indicates "DENUONE\SQLEXPRESS (16.0 RTM) | DENUONE\DeNuONE (52) | SuperStorePOS | 00:00:00 | 20 rows".

8.6 PRODUCT SALES OVERVIEW

VW_PRODUCTSALESOVERVIEW

The screenshot shows the SQL Server Management Studio interface with multiple tabs open. The current tab displays the SQL code for creating the view:

```
-- =====
-- View Name: vw_ProductSalesOverview
-- Description: Provides an overview of products with total sales and current stock
-- =====
CREATE VIEW vw_ProductSalesOverview AS
SELECT
    P.ProductID,
    P.ProductName,
    ISNULL(SUM(D.LineTotal), 0) AS TotalSales,
    ISNULL(S.QuantityAvailable, 0) AS StockAvailable
FROM
    Product P
    LEFT JOIN SalesTransactionDetail D ON P.ProductID = D.ProductID
    LEFT JOIN Stock S ON P.ProductID = S.ProductID
GROUP BY
    P.ProductID, P.ProductName, S.QuantityAvailable;
```

Below the code, the message pane shows "Commands completed successfully." and the completion time. At the bottom, a green status bar indicates "Query executed successfully." and provides connection information.

PURPOSE

Provides an overview of products with total sales and current stock.

CODE & OUTPUTS RESULTS

The screenshot shows the SQL Server Management Studio interface with multiple tabs open. The current tab displays the results of a query against the view:

```
SELECT * FROM vw_ProductSalesOverview;
```

The results grid shows the following data:

	ProductId	ProductName	TotalSales	StockAvailable
1	21	Dettol Antibacterial Soap 100g	300.00	0
2	22	Coca-Cola Bottl 1.5L	600.00	0
3	23	Elephant House Cream Soda Can 330ml	0.00	0
4	24	Nestlé Milo 400g	800.00	0
5	25	LUX Body Wash 250ml	450.00	0
6	26	Pears Baby Lotion 200ml	0.00	0
7	27	Hemnas Velvet Soap 100g	700.00	0
8	3	Highland Butter 200g	950.00	200
9	12	Maliban Lemon Puff 300g	600.00	250
10	2	Kotmale Fresh Milk 1L	1200.00	300
11	14	Keells Chicken Drumsticks 1kg	2400.00	300
12	9	OIC Basmati Rice 1kg	2200.00	350
13	18	Maggi Coconut Milk Powder 300g	1800.00	350
14	8	Ruhunu Red Rice 5kg	1500.00	400
15	19	Sunlight Detergent Powder 2kg	3000.00	400
16	5	Mlesna Black Tea 100g	1200.00	450
17	15	Kotmale Ice Cream Vanilla	1600.00	450

At the bottom, a green status bar indicates "Query executed successfully." and provides connection information.

8.7 EMPLOYEE ROLE SUMMARY

VW_EMPLOYEEROLESUMMARY

The screenshot shows the SQL Server Management Studio interface with four tabs open at the top: SQLQuery8.sql (~...ONE\DeNuONE (64)), SQLQuery7.sql (~...ONE\DeNuONE (63)), SQLQuery6.sql (~...ONE\DeNuONE (54)), and SQLQuery5.sql (~...ONE\DeNuONE (52)). The main query window displays the creation of a view named vw_EmployeeRoleSummary. The code includes a SELECT statement that joins the Employee and Role tables to retrieve EmployeeID, EmployeeName, RoleName, Email, PhoneNumber, and HireDate. A message in the Messages pane indicates that the command completed successfully. The status bar at the bottom right shows the database is DENUONE\SQLEXPRESS (16.0 RTM), the session is DENUONE\DeNuONE (63) - master, and the duration is 00:00:00 with 0 rows affected.

```
-- View Name: vw_EmployeeRoleSummary

9. DATA SECURITY MEASURES

9.1. SECURITY MEASURES

I. DATA ENCRYPTION

Data encryption ensures that sensitive information stored in the database is inaccessible to unauthorized users. For the supermarket POS system:

- **Sensitive Data Encryption:** Encrypt customer personal details, payment methods, and transaction records using advanced encryption standards, such as AES-256.
- **Encrypted Communication:** SSL/TLS for secure data transmission between client and server, preventing man-in-the-middle attacks.
- **Database Encryption:** Implement Transparent Data Encryption (TDE) at the database level to secure data at rest, ensuring that even backups and live data are safe from breaches.

II. USER ROLES

User roles define access levels for database users based on their responsibilities:

- **Role-based Access Control (RBAC):** Assign roles such as Admin, Manager, Cashier, and Analyst.

Admin: Full access, including modifying database schemas and managing permissions.

Manager: Access to reports and sales data is restricted from schema changes.

Cashier: Limited to sales and billing modules only.

Analyst: Can only analyze consolidated sales and stock data.

- Regularly review and update roles to ensure minimal privilege and avoid unauthorized access.

III. PERMISSIONS

Permissions control what users can do:

- **Granular Permissions:** Assign detailed permissions for each role, like SELECT, INSERT, UPDATE, and DELETE.
- **Limit High-Risk Operations:** Limit permissions for data deletion and schema alteration to a few users.
- **Audit Logs:** Enable auditing for all permission changes to track unauthorized modifications.

9.2. DISCUSSION ON POTENTIAL RISKS

I. DATA BREACHES

A data breach occurs when sensitive information is accessed by unauthorized individuals, leading to financial losses, reputation damage, and regulatory penalties.

KEY RISKS:

- Weak passwords or unencrypted data storage.
- Exposure of sensitive information via unsecured APIs.

MITIGATION STRATEGIES:

- Use strong password policies (e.g., 12+ characters, including uppercase, lowercase, numbers, and special characters).
- Implement multi-factor authentication (MFA) for database access.
- Use tools like firewalls and intrusion detection/prevention systems (IDS/IPS) to secure the network perimeter.

II. INSIDER THREATS

Employees or contractors with legitimate access to the database could misuse their access for personal gain or malicious purposes.

KEY RISKS:

- Unauthorized export or manipulation of data.

MITIGATION STRATEGIES:

- Conduct background checks before granting access.
- Enable database activity monitoring (DAM) to track and flag unusual behavior, such as large data exports.
- Use time-limited access for sensitive roles (e.g., temporary admin privileges).

III. WEAK SECURITY CONFIGURATIONS

Misconfigured databases can leave them exposed to attacks.

EXAMPLES:

- Default passwords left unchanged.
- Databases accessible over the internet without proper restrictions.

MITIGATION STRATEGIES:

- Disable unused services and close unnecessary ports.
- Regularly update database systems to address security vulnerabilities.
- Follow CIS Benchmarks or other hardening guides for secure configurations.

IV. SQL INJECTION

Attackers can exploit vulnerable input fields in applications to execute malicious SQL commands (Port Swigger, 2024).

KEY RISKS:

- Unauthorized data extraction, manipulation, or deletion.

MITIGATION STRATEGIES:

- Use parameterized queries or ORM frameworks to prevent direct query injection.
- Sanitize and validate user inputs rigorously.
- Regularly perform penetration testing to identify and fix vulnerabilities.

V. BACKUP THEFT

Database backups often contain sensitive data and are a common target for attackers.

KEY RISKS:

- Unencrypted backups can be copied and exploited.

MITIGATION STRATEGIES:

- Encrypt backups using strong encryption methods.
- Store backups in secure, access-controlled environments, both on-premises and in the cloud.
- Use off-site backup replication with controlled access.

VI. MALWARE AND RANSOMWARE

Malware attacks can encrypt or corrupt data, disrupting operations and leading to data loss.

KEY RISKS:

- Ransom demands for access to encrypted data.

MITIGATION STRATEGIES:

- Install and regularly update anti-malware tools.
- Conduct regular backups and verify the ability to restore data from them.
- Educate employees about phishing and other malware delivery methods.

VII. DENIAL OF SERVICE (DOS) ATTACKS

An attacker could overwhelm the database server, rendering it unavailable.

KEY RISKS:

- Loss of access to critical business systems.

MITIGATION STRATEGIES:

- Implement rate limiting and traffic filtering to mitigate DoS attacks.
- Use load balancers and redundant systems to handle traffic surges.

10. CRITICAL ANALYSIS

10.1 HIGHLIGHT THE 'KEY FEATURES' OF OUR SOLUTION [STRENGTHS]

I. DRAWING ER DIAGRAM (ENTITY-RELATIONSHIP DIAGRAM)

- ✓ **Clear Data Structure Representation:** By visualizing the entities and relationships in your system, the ER diagram aids stakeholders in comprehending the database's structure.
- ✓ **Integrity and Consistency:** It aids in making sure that one-to-many and many-to-many data connections are appropriately specified, guaranteeing accurate and consistent data mapping in the finished product.
- ✓ **Communication Ease:** Developers, designers, and stakeholders can use the diagram as a guide for development and communication.

II. DATA MAPPING

- ✓ **Data Transformation and Flow:** Guarantees the proper flow of data from one system element (also called target) to another while applying different transformations of the source data to the target data.
- ✓ **Consistency in Data Types:** Mappings (talend a quick company, 2024) done properly guarantee that the source and destination systems have consistent data types, formats, and values, hence data inconsistency is avoided.
- ✓ **Data Quality Control:** Achieving a clear mapping business process makes it possible to easily tell if there are potential errors or misaAutomated Workflows and Actions: Stored procedures eliminate the requirement for application-level coding by enabling the execution of preset, reusable logic, guaranteeing consistent system behavior.
- ✓ Enforcement of Business Rules: When certain database actions (like inserts, updates, or deletions) take place, triggers can automatically enforce business rules (such prohibiting invalid data insertion) to guarantee data integrity and compliance.
- ✓ Performance Optimization: By moving business logic to the database layer, you may minimize data processing at the application level, which lowers network traffic and boosts performance.

- Error Handling: To ensure that unforeseen problems are effectively handled, procedures and triggers might incorporate error handling techniques.
- ✓ Alignment that can make the data lose quality.

III. DATA DICTIONARY

- ✓ **Centralized Data Documentation:** The data dictionary (Science Direct, 2024) describes in detail each element of the database, including tables, columns, data types, and constraints ensuring that there are no hidden meanings.
- ✓ **Improved Collaboration:** Since all the participants involved in the designing or the maintenance of the database system use a single base of information, it improves collaboration and reduces chances of miscommunication.
- ✓ **Facilitates Maintenance:** The data dictionary is a useful tool in case of any problems with the database, which makes subsequent changes and maintenance easier.

IV. DATA NORMALIZATION

- ✓ **Decreases Redundancy:** Normalization achieves minimum redundancy of data by structuring information into several inter related tables where each data item is entered only one time.
- ✓ **Greater Data Quality:** Through normalization (up to 3NF or beyond), you reduce the chances of various anomalies occurring such as insertion, deletion or update anomalies to better the state of the data.
- ✓ **Improved Performance of Queries:** Tables that are efficiently normalized are said to enhance the performance of the queries by eliminating the duplication of data that is not required.

V. CREATING DATABASES AND TABLES

- ✓ **Systematic Storage Construction:** Systematizing database schema design and tables construction enhances logical storage and organization of data.
- ✓ **Scalability And Flexibility:** The design gives the provision of scaling up of solution and modification of the schema according to the changing needs of the system.
- ✓ **Data Integrity:** The tables are designed with the right number of constraints (primary keys, foreign keys, unique constraints) so that the data is accurate and consistent.

VI. FUNCTIONS AND VIEWS IN TABLES

- ✓ **Implementation of Custom Business Logic:** Functions make it possible to directly encapsulate business logic in the database, which enhances performance and streamlines the application layer.
- ✓ **Simplified Data Retrieval:** Views offer a practical means of displaying data without altering the underlying schema, which facilitates straightforward queries on complicated data.
- ✓ **Security and Access Control:** By revealing only the information that is required, views can help limit user access to sensitive data, improving security.

VII. STORED PROCEDURES AND TRIGGERS

- **Automated Workflows and Actions:** Stored procedures eliminate the requirement for application-level coding by enabling the execution of preset, reusable logic, guaranteeing consistent system behavior.
- **Enforcement of Business Rules:** When certain database actions (like inserts, updates, or deletions) take place, triggers can automatically enforce business rules (such prohibiting invalid data insertion) to guarantee data integrity and compliance.
- **Performance Optimization:** By moving business logic to the database layer, you may minimize data processing at the application level, which lowers network traffic and boosts performance.
- **Error Handling:** To ensure that unforeseen problems are effectively handled, procedures and triggers might incorporate error handling techniques.

10.2 IDENTIFY AND EXPLAIN THE 'AREAS THAT NEED IMPROVEMENTS' [WEAKNESSES]

I. ER DIAGRAMS (ENTITY-RELATIONSHIP DIAGRAMS)

WEAKNESSES:

- ✓ **Relationship ambiguity:** Relationships between entities can occasionally be unclear, making it difficult to grasp how various system components interact. For instance, ambiguous many-to-many or one-to-many connections.
- ✓ **Overcomplication:** When there are too many entities and relationships in an ER diagram, it might become difficult for stakeholders (BYJU'S, 2024) to understand.
- ✓ **Inaccurate cardinalities:** Poor database architecture and inaccurate associations can result from the misuse or nonexistence of suitable cardinalities (such as many-to-many, one-to-many, and one-to-one).
- ✓ **Lack of normalization:** Inefficient and duplicated data might result from improperly normalized data models, which are occasionally reflected in ER diagrams.
- ✓ **Ignoring business rules:** Complex business rules, constraints, or conditional logic that need to be implemented at the database level are frequently overlooked by ER diagrams.

IMPROVEMENTS:

- ✓ Make sure the relationships are explicit and well-defined.
- ✓ Simplify intricate diagrams by concentrating on high-level entities or dividing them into smaller sub-diagrams.
- ✓ Verify each relationship's cardinality in light of practical needs.
- ✓ To prevent redundant data, take normalization principles into account when designing.
- ✓ As much as you can, incorporate business rules into the ER diagram.

II. DATA MAPPING

WEAKNESS

- ✓ **Data types that are inconsistent:** When various data sources are mapped, it may result in data types that are incompatible or mismatched (e.g., integer vs. string).
 - ✓ **Incomplete mapping:** Missing characteristics or tables might result from not always capturing all the data necessary.
 - ✓ **Absence of mapping documentation:** Team members and developers working on the system may become confused if the mapping procedure is not adequately documented.
 - ✓ **mistakes in layer mapping:** Inadequate layer mapping (such as database, business logic, and user interface) can result in mistakes and inconsistent data.
-

IMPROVEMENTS:

- ✓ Verify that data types are appropriately aligned across systems and that conversion methods are used when needed.
 - ✓ Make a thorough mapping document that incorporates all of the data relationships and properties.
 - ✓ Verify the data mapping on a regular basis with business stakeholders to make sure the design satisfies practical requirements.
 - ✓ Create a structured procedure for managing data inconsistencies and modifications during the mapping process.
-

III. DATA DICTIONARY

WEAKNESS

- ✓ **Lack of standardization:** Teams may become confused if the data dictionary does not adhere to a common naming practice.
 - ✓ **Inadequate definitions:** Some fields, tables, and relationships are not well explained, which makes it difficult to grasp their use or purpose.
 - ✓ **Absence of rules or constraints:** Data dictionaries can lack crucial rules for data validation or restrictions (such as unique, foreign keys).
 - ✓ Outdated or erroneous information The data dictionary may become a source of errors and false information if it is not updated on a regular basis.
-

IMPROVEMENTS

- ✓ Create and implement uniform naming guidelines.
- ✓ Give each table, column, constraint, and relationship a precise definition.
- ✓ Make sure the dictionary contains all applicable validation, rules, and constraints for the data.
- ✓ Update the data dictionary frequently to take into account modifications to the data structure or schema.

IV. DATA NORMALIZATION

WEAKNESSES

- ✓ **Over-normalization:** Too many tables may result from excessive normalization, which may slow down queries by requiring too many joins.
 - ✓ **Under-normalization:** Inadequate normalization can result in abnormalities, redundant data, and trouble preserving consistency.
 - ✓ **Ignorance of trade-offs:** It's common to ignore the need to strike a balance between normalization and performance considerations (e.g., denormalization for speed).
 - ✓ **Inconsistent application:** A difficult-to-maintain design may arise from applying normalization inconsistently across tables.
-

IMPROVEMENTS

- ✓ Maintain performance requirements while applying normalization up to the proper level, which is often 3NF.
 - ✓ Review the schema frequently to make sure normalization is applied correctly.
 - ✓ When performance optimizations are required, such as for large-scale reporting, take into account denormalization or partial normalization.
 - ✓ Assess the normalization procedure in light of the database workload and the particular requirements of the application.
-

V. CREATING DATABASE AND TABLES

WEAKNESSES

- ✓ **accurate relationships between primary and foreign keys:** Inconsistencies in the database and problems with referential integrity might result from improper key configuration.
 - ✓ Ignoring indexing Performance issues may arise if frequently searched columns are not indexed.
 - ✓ **Disregarding performance and scalability requirements:** Inadequate table design may function well for little datasets but not well at scale.
 - ✓ **Absence of nullability constraints or default values:** Certain columns may not have default values or may permit null values in inappropriate places.
-

IMPROVEMENTS:

- ✓ Give primary keys, foreign keys, and any required restrictions careful definitions.
- ✓ Take indexing on commonly used columns into account while designing for performance
- ✓ Use sharding, partitioning, or other effective data distribution strategies to account for scalability.
- ✓ Establish nullability constraints and reasonable defaults to implement business rules at the database level.

VI. FUNCTIONS AND VIEWS IN TABLES

WEAKNESSES:

- ✓ **Performance problems:** Functions and views can have a detrimental impact on performance if they are abused or misused, particularly if they are not optimized or include intricate logic.
 - ✓ **Poor visibility:** It may be challenging to debug or comprehend the underlying actions due to complex logic within functions or views.
 - ✓ **Lack of reusability:** Sometimes the design of functions or views makes it difficult to use them in different queries or contexts.
-

IMPROVEMENTS

- ✓ Reduce performance overhead by optimizing functions and views, especially when they are utilized in complex queries.
 - ✓ Make sure that views and functions have adequate documentation so that other developers can understand them.
 - ✓ Make an effort to create reusable views and functions that can be used in other application sections.
-

VII. PROCEDURES AND TRIGGERS IN TABLES AND DATABASE

WEAKNESSES

- ✓ **Overcomplicating logic:** Complex or business-specific logic may be more difficult to maintain and debug when stored procedures and triggers are used.
 - ✓ **Absence of transaction management:** When processes and triggers don't manage transactions correctly, it might result in inconsistent data.
 - ✓ **Performance issues:** If triggers and procedures are not properly optimized, they may cause data manipulation activities to lag.
 - ✓ **Dependencies that are difficult to control:** Triggers may produce unforeseen side effects or circular dependencies in the database.
-

IMPROVEMENTS

- ✓ To prevent adding needless complexity, keep stored processes and triggers as basic as possible.
- ✓ Implement appropriate transaction management and error handling within triggers and methods.
- ✓ Analyze how triggers and procedures affect database operations to maximize their performance.
- ✓ Make sure stored procedures and triggers don't generate performance bottlenecks or hidden dependencies by reviewing and refactoring them on a regular basis.

10.3 FUTURE IMPLEMENTATIONS

I. ER DIAGRAM DRAWING

FUTURE IMPLEMENTATIONS:

- ✓ **include sophisticated connection types:** To better simulate real-world situations, include more intricate relationships such as ternary relationships, recursive relationships, and subtype/supertype hierarchies.
- ✓ Implementing tools that can automatically create ER diagrams from the database schema or code will help to ensure that design and implementation are in sync.
- ✓ Enable real-time collaboration on ER diagrams so that various stakeholders, like developers and business analysts, can work together to update and discuss the diagram.
- ✓ **Tracking changes and managing versions:** To monitor changes over time and facilitate the reversal or review of design choices, use version control for ER diagrams.
- ✓ **Combining more tools:** Permit the ER diagram tool to interface with CI/CD, testing, and project management systems.

II. DATA MAPPING

FUTURE IMPLEMENTATIONS:

- ✓ **Automation of data mapping:** Use algorithms or automated technologies to help with data mapping, which can expedite the process and minimize human mistake. Based on past trends, machine learning may be able to forecast data mapping.
- ✓ Enable data lineage features to monitor the movement of data from its source to its destination, improving transparency and comprehension of data transformations.
- ✓ **Advanced validation of mapping:** To find discrepancies, mismatches, or missing properties in data mappings, use automated validation. This guarantees error-free and seamless data integration.
- ✓ **Assistance with a variety of data sources:** Allow data mapping to accommodate a greater range of data sources (such as NoSQL databases, external APIs, and cloud storage) and formats (such as JSON, XML) as systems grow more complicated.

III. DATA DICTIONARY

FUTURE IMPLEMENTATIONS:

- ✓ **Data dictionary updates that happen automatically:** Create tools that update the data dictionary automatically whenever the schema is modified. This would lessen the possibility of missing or out-of-date documentation.
- ✓ **Advanced search and tagging:** Enhance the data dictionary's search capabilities to enable looking for information using relationships, business terms, or data lineage.

- ✓ **Features of collaboration:** Allow several team members to participate and check definitions, restrictions, and other metadata by enabling real-time collaboration when changing and evaluating the data dictionary.
- ✓ **Connecting to tools for managing metadata:** Provide insights into data consumption, linkages, and impact across systems by integrating the data dictionary with more comprehensive metadata management frameworks.
- ✓ **Metadata version control:** Implement version control for the data dictionary to manage several schema versions and monitor changes over time.

IV. DATA NORMALIZATION

FUTURE IMPLEMENTATIONS:

- ✓ Use tools that can automatically recommend different levels of normalization depending on the quantity of the data, query patterns, and performance requirements. These are known as dynamic normalization tools.
- ✓ **In favor of hybrid normalization:** Permit hybrid approaches in which some tables are denormalized for performance reasons (e.g., in reporting or OLAP systems) while others can be highly normalized.
- ✓ **Denormalization with intelligence:** Use machine learning models to predict when and when denormalization will enhance performance, such as in workloads that require a lot of reading or reporting.
- ✓ **Use case-based normalization guidelines:** To balance data integrity and performance, define normalization standards according to particular use cases, such as transactional systems (OLTP) or analytical systems (OLAP).
- ✓ **NoSQL database normalization:** Provide normalization strategies appropriate for non-relational databases as NoSQL databases proliferate.

V. CREATING DATABASE AND TABLES

FUTURE IMPLEMENTATIONS:

- ✓ **Automated database schema generation:** Programs that can produce database schema straight from user stories, business requirements, or ER diagrams will help create databases more quickly and with fewer errors.
- ✓ **Database sharding and partitioning:** Use automated sharding and partitioning techniques to provide scalability and effective data distribution for extremely big databases.
- ✓ **Multi-model database support:** Allow the system to support and smoothly integrate several database types (such as relational, graph, and document-based) as database technology advances.
- ✓ **Management of database evolution:** As the system develops over time, handle schema changes with database versioning and migration tools to maintain backward compatibility and seamless version transitions.
- ✓ **Cloud database optimization:** Provide capabilities like automatic scalability, backup, and recovery to enable the best possible database creation and scaling in cloud environments.

VI. FUNCTIONS AND VIEWS IN TABLES

FUTURE IMPLEMENTATIONS:

- ✓ **Materialized views:** Add support for materialized views, which store and refresh query results on a regular basis to enhance performance, particularly for intricate, often-used queries.
- ✓ Using performance optimization tools that automatically recommend or restructure SQL functions in response to query performance metrics is known as automated function optimization.
- ✓ **Serverless functions:** Reduce operational cost by using serverless compute to handle sophisticated functions that can scale dynamically without requiring infrastructure management.
- ✓ Implementing a more adaptable data access layer will enable functions and views to be abstracted into reusable modules, making it simpler to integrate them across various application components.
- ✓ **AI-assisted views:** By automatically combining frequently accessed data, AI can be used to help construct complicated views based on user behavior or data trends, enhancing query efficiency.

VII. PROCEDURES AND TRIGGERS IN TABLES AND DATABASE

FUTURE IMPLEMENTATIONS:

- ✓ Transition to event-driven architectures, which allow for dynamic and responsive database interactions by having triggers respond in real-time to system events.
- ✓ **Distributed procedures:** Allow stored procedures to be defined and run across distributed databases or microservices architectures as databases grow, guaranteeing consistent logic execution throughout the system.
- ✓ **Procedural versioning:** When a new version of the database is released or schema changes are made, incorporate version control for triggers and procedures to guarantee backward compatibility.
- ✓ **Automated error handling and logging:** Improve error handling, logging, and monitoring in triggers and stored procedures to aid in system tracking and debugging.
- ✓ **AI for trigger optimization:** Make sure that triggers don't result in performance snags by using AI to examine trigger behavior.

11. APPENDICES

11.1 TABLES WITH CONSTRAINTS

```
/*=====
||          CUSTOMER MANAGEMENT          ||
=====*/
/*
-- Creating Customer table
-----*/
CREATE TABLE Customer (
    CustomerID INT PRIMARY KEY IDENTITY(1,1),
    FirstName NVARCHAR(100) NOT NULL CHECK (LEN(FirstName) > 1),
    LastName NVARCHAR(100) NOT NULL CHECK (LEN(LastName) > 1),
    Email NVARCHAR(255) UNIQUE CHECK (Email LIKE '%@%.%'),
